

MOTOWN SOLUTIONS

Where your cloud bill actually goes

SWIPE

Compute is rarely the problem

The cost is egress, capacity reserved for a rare peak, and managed services priced for a bigger company.

Start with an inventory

Every workload either moves as it is, needs a bridge, or stays where it is.

Files move to R2

Same S3 API, no egress fees. For apps that serve files, that alone is often the business case.

Servers become Workers

Billed per request and scaled to zero when traffic is quiet, with nothing sized for peak.

Some things should stay

GPU workloads, long-running stateful services and hard-won compliance boundaries stay, with Cloudflare in front.

Cut over route by route

Routes move one at a time behind the DNS you already have, and users keep the same URLs.
