

MOTOWN SOLUTIONS

Inheriting a codebase that still works

SWIPE

Nothing was broken

The site worked. Underneath, every fragile part was holding something up, so every change felt risky.

The first month shipped nothing

We made the system runnable, deployable and reproducible before touching a feature.

Every move had a reason

Invisible to search engines, a framework near end of support, editors waiting on a developer.

Every step could be undone

The old API stayed running, rollback was one setting, and the migration copied without deleting.

A site that publishes itself

352 static pages. Editors hit publish, the site rebuilds, and a broken build never reaches production.
