# What to build first in your MVP

SWIPE

# Find the one loop

The single user journey that proves the idea works. That is what goes into the first version.

# Write the rest down

Every other feature goes on a written list. Good ideas mid-build go there too, so the launch date holds.

# Build the loop properly

Accounts, payments, backups and a deploy pipeline from day one. Small scope is no excuse for shaky plumbing.

# Skip the scale you don’t have

Build simply, with a cost model for 100 and 10,000 users, and rewrite once the product has earned it.

# Own it from the first commit

Your repo, your accounts, your deploy button. A new engineer can pick it up without calling us.

# Read the full write-up
